FT - 51R
Technical Supplement

This manual provides the technical information necessary for servicing the FT-51R Dual-Band handheld amateur transceiver.

Servicing this equipment requires expertise in handling surface-mount chip components. Attempts by non-qualified persons to service this equipment may result in permanent damage not covered by the warranty, and may be illegal in some countries.

Two PCB layout diagrams are provided for each double-sided board in this transceiver. Each side of the board is referred to by the type of the majority of components installed on that side ("leaded" or "chip-only"). In most cases one side has only chip compo-

nents, and the other has either a mixture of both chip and leaded components (trimmers, coils, electrolytic capacitors, ICs, etc.), or leaded components only.

While we believe the information in this manual to be correct, Yaesu Musen assumes no liability for damage that may occur as a result of typographical or other errors that may be present. Your cooperation in pointing out any inconsistencies in the technical information would be appreciated.

Yaesu Musen reserves the right to make changes in this transceiver in the interest of technological improvements, without notification to the owners.

Specifications

General

Frequency range:	(Rx) 110~180 MHz 420~470 MHz (Tx) 144~148 MHz 430~450 MHz
Channel steps:	5, 10, 12.5, 15, 20, 25 & 50 kHz
Repeater shift:	±600 kHz , ±5 MHz (programmable)
Emission type:	F3, F2
Supply voltage:	4.0 ~ 12-V DC
Current Consumption:	VHF UHF
Auto Power Off:	200 µA 200 µA
Stby (Saver on):	16.9 mA 16.3 mA (34 mA dual-rx)
Stby (Saver off):	52 mA 49 mA (85 mA dual-rx)
Tx (5 W @ 9.6VDC):	<1.6A <1.9A
Antenna (BNC jack):	YHA-55 rubber flexible
Case size (WHD):	57 × 122 × 26.5 mm w/FNB-31
Weight (approx.):	330 grams with FNB-31 & antenna

Receiver

Circuit type:	Double-conversion superheterodyne
IFs:	45.05 MHz & 455 kHz (VHF) 58.525 MHz & 455 kHz (UHF)
12-dB SINAD Sensitivity:	< 0.158 µV (VHF) < 0.180 µV (UHF)
Adjacent channel selectivity:	> 65 dB VHF > 60 dB UHF
Intermodulation:	> 65 dB (VHF), > 60 dB (UHF)
AF output:	0.2 W @ 8Ω for 10% THD

Transmitter

RF output:	See the chart at right
Frequency stability:	Better than ± 5 ppm (at -10°C ~ +60° C)
Modulation system:	Variable reactance
Maximum deviation:	± 5 kHz
FM Noise (@ 1 kHz):	Better than -40 dB @ 1 kHz
Spurious emissions:	> 60 dB below carrier
AF distortion (@ 1 kHz):	< 5%, w/3.5 kHz deviation
Microphone type:	2-kΩ condenser

Battery Type	VHF Output	UHF Output
FBA-14 Dry Cell Case (4 x "AA" cells)	2.0 W	1.5 W
FNB-31 (4.8V, 600 mAh)	2.0 W	1.5 W
FNB-33 (4.8V, 1200 mAh)	2.0 W	1.5 W
FNB-35 (7.2V, 900 mAh)	4.0 W	3.5 W
FNB-38 (9.6V, 600 mAh)	5.0 W	5.0 W

Specification subject to change without notice.

Chip Component Information

The diagrams below indicate some of the distinguishing features of common chip components.

Ceramic Capacitors

(Unit: mm)

Type	L	W	H
2125	2.0	1.25	0.35~0.50
1608	1.6	0.8	0.65~0.95
1005	1.0	0.5	0.45~0.55

Tantalum Capacitors

(Unit: mm)

Type	L	W	H
P	2.0	1.25	1.2
A	3.2	1.6	1.6
B	3.4	2.8	1.9
C	5.8	3.2	2.3

Resistors

Type RMC 1/10W, 1/16W

Marking* 100, 222, 473 ...

Indicated Letters

0	0	10^0
1	1	10^1
2	2	10^2
3	3	10^3
4	4	10^4
5	5	10^5
6	6	10^6
7	7	10^7
8	8	10^8
9	9	10^9

Examples:
100 = 10 Ω
222 = 2.2k Ω
473 = 47k Ω

Chip Component Information

Replacing Chip Components

Chip components are installed at the factory by a series of robots. The first one places a spot of adhesive resin at the location where each part is to be installed, and later robots handle and place parts using vacuum suction.

For single-sided boards, solder paste is applied to the board is then baked to harden the resin and flow the solder. For double-sided boards, no solder paste is applied, but the board is baked (or exposed to UV light) to cure the resin before dip-soldering.

In our laboratories and service shops, small quantities of chip components are mounted manually by applying a spot of resin, placing with tweezers, and then soldering by very small dual streams of hot air (without physical contact during soldering). We remove the parts by first removing solder using a vacuum suction iron, which applies a light, steady vacuum at the iron tip, and then breaking the adhesive with tweezers.

The special vacuum soldering/de-soldering equipment is recommended if you expect to do a lot of chip replacements. Otherwise, it is usually possible to remove and replace chip components with only a tapered, temperature controlled soldering iron, a set of tweezers and braided copper solder wick. Soldering iron temperature should be below 280°C (536°F).

Precautions for Chip Replacement

Do not disconnect a chip forcefully, or the foil pattern may peel off the board.

Never re-use a chip component. Dispose of all removed chip components immediately to avoid mixing with new parts.

Limit soldering time to 3 seconds or less to avoid damaging the component and board.

Removing Chip Components

- Remove the solder at each joint, one joint at a time, using solder wick wetted with non-acidic flux as shown below. Avoid applying pressure, and do not attempt to remove the tinning from the chip's electrode.

- Grasp the chip on both sides with tweezers, and gently twist the tweezers back and forth (to break the adhesive bond) while alternately heating each electrode. Be careful to avoid peeling the foil traces from the board. Dispose of the chip when removed.

- After removing the chip, use the copper braid and soldering iron to wick away any excess solder and smooth the land for installation of the replacement part.

Installing a Replacement Chip

As the value of some chip components is not indicated on the body of the chip, be careful to get the right part for replacement.

- Apply a small amount of solder to the land on one side where the chip is to be installed. Avoid using too much solder, which may cause bridging (shorting to other Parts).

- Hold the chip with tweezers in the desired position, and apply the soldering iron with a motion line that is indicated by the arrow in the diagram below. Do not apply heat for more than 3 seconds.

- Remove the tweezers and solder the electrode on the other side in the manner just described.

Notes

Transceiver Disassembly and PCB Access

CNTL Unit Removal

Turn the radio off then remove the battery and soft case, if used.

- Use a deep-ended wrench to remove the lock nut from the DIAL knob (Figure 1). Also remove the small screw located between the **EAR** and **MIC** jack on the top panel.

Figure 1.

- Carefully separate the front and rear transceiver halves, set the front half aside for now.
- Remove the three (3) screws as shown below, and separate the **CONTACT** assembly from the main unit. Be careful not to lose the battery release slide and its small screw.

Figure 3.

- Lay the transceiver on a flat surface covered with a soft cloth to protect the front case from marring, and remove the eight (8) rear-panel screws (Figure 2). Be careful not to mix removed screws (some appear similar, but have different types of threading/pitch).

Figure 2.

- Disconnect the flat ribbon cable from its connector on the **CNTL Unit** by using two fingertips to slide out the cable release, then unplug the cable from the **Mother Unit** (Figure 4).

Figure 4.

Transceiver Disassembly and PCB Access

- Next angle the CNTL Unit upward and outward away from the MAIN Unit.

Figure 5.

Contact Unit Removal

- Use a small flat screw driver and slowly pry the two mating connectors and CONTACT Unit PCB free from the 144 and 430 Mother Unit boards, as shown below (Figure 6). Alternately pry between the two points to separate the unit. **Warning!** Use extreme caution during this step, as delicate surface-mounted components are located around the pry-points.

Figure 6.

144-Mother Unit Removal

- Referring to Figure 7, remove the five (5) screws from the 144 Mother Unit, then carefully lift the copper shield plate to expose the 144-Mother Unit assembly.

Figure 7.

- Lift the 144-Mother Unit up to free it from inter-board connector J1001.

430 Mother Unit Removal

- With the 144-Mother Unit removed, lift the shield plate to expose the 430-Mother Unit, as shown below (Figure 8).

Figure 8.

- Remove the single screw at the upper-left corner of the 430-Mother Unit to remove the BNC antenna jack (see Figure 9 on top of next page).

Transceiver Disassembly and PCB Access

Figure 9.

- This completes the disassembly procedure, reassemble all units in the reverse manner, paying attention to screw type and location. With the CNTL Unit removed, the translucent keyboard membrane, PTT or POWER switch covers can be popped out for replacement if needed.

*Be sure to keep the rubber gasket around the CNTL Unit **MIC** & **EAR** jack, and to carefully align it with case cut-out when reinstalling the CNTL Unit into the case.*

Lithium Backup Battery Replacement

The lithium backup battery does not normally need to be replaced for several years. However, to replace the cell, order Yaesu P/N Q9000627.

- With the CNTL Unit exposed, note the tab polarity of BT1001.

Exploded View & Miscellaneous Parts

The FT-51R is carefully aligned at the factory for the specified performance across the amateur band. Realignment should therefore not be necessary except in the event of a component failure. All component replacement and service should be performed only by an authorized Yaesu representative, or the warranty policy may be void.

The following procedures cover the sometimes critical and tedious adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts subsequently are replaced, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed only by authorized Yaesu service technicians who are experienced with the circuitry and fully equipped for repair and alignment. Therefore, if a fault is suspected, contact the dealer from whom the transceiver was purchased for instructions regarding repair. Authorized Yaesu service technicians realign all circuits and make complete performance checks to ensure compliance with factory specifications after replacing any faulty components.

Those who do undertake any of the following alignments are cautioned to proceed at their own risk. Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, Yaesu reserves the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners.

Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and realignment determined to be absolutely necessary.

The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Correction of problems caused by misalignment resulting from use of improper test equipment is not covered under the warranty policy. While most steps do not require all of the equipment listed, the interactions of some adjustments may require that more complex adjustments be performed afterwards. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Have all test equipment ready before

beginning, and follow all of the steps in a section in the order presented.

Required Test Equipment

- ☐ RF Signal Generator with calibrated output level at 500 MHz
- ☐ Deviation Meter (linear detector)
- ☐ In-line Wattmeter with 5% accuracy at 500 MHz
- ☐ 50- Ω RF Dummy Load
- ☐ 8- Ω AF Dummy Load
- ☐ Regulated DC Power Supply adjustable from 3 to 12 VDC, 2A
- ☐ Frequency Counter: 0.2 ppm accuracy at 500 MHz
- ☐ AF Signal Generator
- ☐ AC Voltmeter
- ☐ DC Voltmeter: high impedance
- ☐ VHF/UHF Sampling Coupler
- ☐ SINAD Meter

Alignment Preparation & Precautions

A 50- Ω dummy load and in-line wattmeter must be connected to the main antenna jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna.

After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except dummy load and wattmeter, if connected) before proceeding.

Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this temperature be held constant between 20° and 30°C (68° - 86°F). When the transceiver is brought into the shop from hot or cold air, it should be allowed some time to come to room temperature before alignment.

Whenever possible, alignments should be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

Note: Signal levels in dB referred to in the alignment procedure are based on 0 dB μ = 0.5 μ V.

Alignment

Alignment Power Connections

The FT-51R must be partially disassembled to perform the following three steps. The contact assembly must be removed to allow access to the adjustment points, and power must be applied using miniature hook-on clips. The graphics below show the test-point locations and how to connect the hook-on clips. Refer to the *PCB Access & Disassembly* chapter for proper disassembly instructions, and ensure you have the proper hook-on clips before beginning.

Alignment Points & Power Connection

PLL & Transmitter

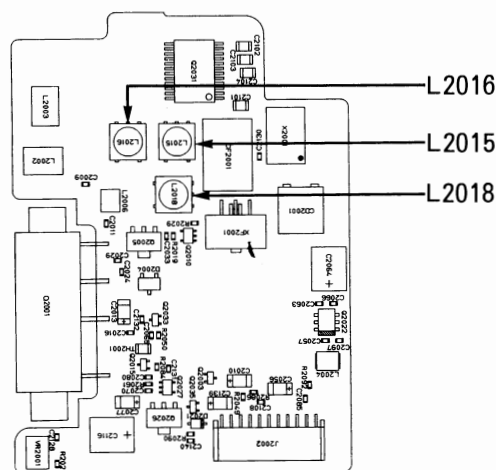

Set up the test equipment as shown for transceiver alignment. With the battery contact assembly removed, apply 11 VDC power to the transceiver using miniature hook-on clips applied to the points on the Contact Unit PCB as shown below.

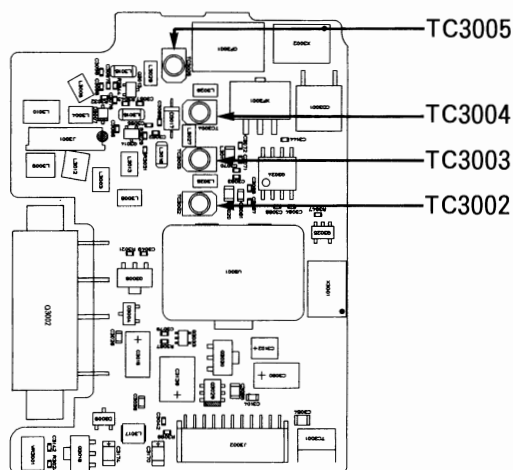

Hook-On Clip DC Power Connection

Refer to the drawings below for VHF and UHF Alignment Points.

144-Mother Unit Alignment Points

430-Mother Unit Alignment Points

PLL Reference Frequency

- With the wattmeter, dummy load and frequency counter connected to the antenna jack, and while tuned to the center of the UHF band, key the transmitter and adjust **TC3001** on the 430-Mother Unit, if necessary, so the counter frequency is within 100 Hz of the displayed frequency on the FT-51R.

Transmitter Power Adjustment

- Connect the 50-Ω dummy load and inline wattmeter to the antenna jack. Tune to the UHF band center and select high power output. Key the transmitter and adjust **VR3001** on the 430-Mother Unit for $5\text{ W} \pm 0.2\text{ W}$ on the meter.
- Tune to VHF band center and select high power output. Key the transmitter and adjust **VR2001** on the 144-Mother Unit for $5\text{ W} \pm 0.2\text{ W}$ on the meter.

144-Mother Unit Interstage Transformer Alignment

- Connect the RF signal generator to the antenna jack, and connect the 8-Ω dummy load and SINAD meter to the **EAR** jack.
- Tune the transceiver and the RF signal generator to the band center, and inject a signal modulated with $\pm 3.5\text{ kHz}$ deviation of a 1-kHz tone.
- Adjust **L2015**, **L2016** and **L2018** on the 144-Mother Unit for optimum 12 dB SINAD (at least -9 dBμ for 12 dB SINAD).

430-Mother Unit Interstage Transformer Alignment

Important! Before proceeding, ensure the 430-Mother Unit is grounded to the transceiver rear case by reinstalling the five previously removed screws.

- Unplug the CONTACT Unit from the 144- & 430-Mother Unit assembly. Next, remove the 5 screws from the shield case on the 144-Mother Unit, and remove the shield case.
- Remove the 144-Mother Unit to expose the 430-Mother Unit. Plug the CONTACT Unit into the 430-Mother Unit. Connect the RF signal generator to the antenna jack, and 8-Ω dummy load and SINAD meter to the **EAR** jack.
- Tune the transceiver and the RF signal generator to the band center and inject a signal modulated with $\pm 3.5\text{ kHz}$ deviation of a 1-kHz tone.
- Adjust **TC3002~TC3005** for optimum 12 dB SINAD (at least -8dBμ for 12 dB SINAD). This complete the first part of the alignment, re-assemble the transceiver and proceed to the *Internal System Alignment Routine*.

Internal System Alignment Routine

The remainder of the alignment uses a routine programmed in the transceiver. This routine simplifies many previously complex discrete component settings and adjustments with digitally-controlled settings via front panel buttons and LCD indications.

Transceiver adjustments include:

- Band & IF Selection (*non-adjustable*)
- S-Meter Full Scale & S-1 Adjustment
- Squelch Threshold & Tight Adjustment
- Modulation (Low & High) Adjust
- To begin, set the transceiver to the VHF and UHF band center, then turn the transceiver off. Next, press and hold **VOL/SQL** and **DTMF/CALL** together while powering the radio again. The display now shows the first setting. *Note that the first two settings are not adjustable and are left as set from the factory.*

In the alignment, each adjustment is selected by rotating the DIAL knob. Alignment is performed by holding the **FM** key for ½ second (**F** blinks), then injecting a signal of the required frequency and level.

Pressing **FM** after a level setting or adjustment is made stores the entry. To exit the alignment routine, press **DTMF/CALL**. After performing the system alignment in its entirety, individual settings can be returned to and adjusted should the need arise.

Alignment

VHF Alignment

S-Meter Full-Scale Adjust(VHF)

- ☐ If you haven't done so already, perform the power-on key combination previously described then press **[M]** → **[BAND OFF]** so that the right display blanks. Next hold **[M]** for ½ second (**F** blinks), at the beginning of each selection.
- ☐ Inject a +20dBμ RF signal (±3.5kHz deviation @ 1-kHz) to the antenna input, press **[M]** to save the setting (**F** turns off), then rotate the DIAL knob for the next setting.

Low-Scale S-1 Adjustment(VHF)

- ☐ Adjust the generator level to -5dBμ, press **[M]** and rotate the DIAL for the next setting.

Squelch Preset Threshold(VHF)

- ☐ Adjust the generator level for a -11dBμ signal, press **[M]** and rotate the DIAL for the next setting.

Squelch Preset Tight (VHF)

- ☐ Adjust the generator level for a -5dBμ signal, then press **[M]** and rotate the DIAL for the next setting.

Tx Deviation (VHF) For A3, B3 & C3 Versions only.

- ☐ While tuned to 160.000 MHz, adjust the AF generator level for 25 mV_{rms} @1 kHz to the **MIC** jack.
- ☐ Hold **[M]** for ½ second, then key the tx and press **[▲]** / **[▼]** to obtain ±4.2 ~ 4.5 kHz on the deviation meter (±3.7 ~ 4.0 kHz for A3 version). Press **[M]** and rotate the DIAL knob for the next setting.

Tx Deviation (VHF)

- ☐ Tune to 146.000 MHz and adjust the AF generator for 25 mV_{rms} output @ 1 kHz to the **MIC** jack. Key the transmitter and press **[▲]** / **[▼]** to obtain ±4.2 ~ 4.5 kHz indicated on the deviation meter (±3.7 ~ 4.0 kHz for A1, A2 & A3 versions). Press **[M]** and rotate the DIAL knob for the next setting.

UHF Alignment

S-Meter Full-Scale Adjust(UHF)

- ☐ Press **[M]** → **[BAND OFF]** so that the left display blanks. Remember to hold **[M]** for ½ second (**F** blinks), at the beginning of each selection.
- ☐ Inject a +20dBμ RF signal (±3.5kHz deviation @ 1-kHz), press **[M]** to save the entry (**F** stops blinking), then rotate the DIAL knob for the next setting.

Low-Scale S-1 Adjustment(UHF)

- Adjust the RF signal generator level for -5dBμ, press **[M]** and rotate the DIAL for the next setting.

Squelch Preset Threshold(UHF)

- Adjust the RF signal generator level for -11dBμ, press **[M]** and rotate the DIAL for the next setting.

Squelch Preset Tight (UHF)

- Adjust the RF signal generator level for -5dBμ, then press **[M]** and rotate the DIAL for the next setting.

Tx Deviation (UHF) for A3, B3 & C3 Versions only

- While tuned to 460.000 MHz, adjust the AF generator for 25 mV_{rms} output @ 1 kHz to the **MIC** jack.
- Hold **[M]** for 1/2 second, then key the transmitter and press **[▲]/[▼]** to obtain ±4.2 ~ 4.5 kHz indicated on the deviation meter (±3.7 ~ 4.0 kHz for A3 version). Press **[M]** and rotate the DIAL knob for the next setting.

Tx Deviation Adjustment UHF

- Return to the UHF band center, then adjust the AF generator attenuator level for 25 mV_{rms} @ 1 kHz to the **MIC** jack. Key the transmitter and press **[▲]/[▼]** to obtain ±4.2 ~ 4.5 kHz indicated on the deviation meter (±3.7 ~ 4.0 kHz for A1, A2 & A3 versions).

This completes the internal alignment routine, to save all settings and exit, press **[CALL]**, the frequency display will return to normal.

CPU Reset

As a last resort, if you are unable to gain control of the transceiver, the FT-51R can be reset from the keypad to clear all settings, memories, channel step and repeater shifts to their factory defaults.

To do this, hold **SKIP *** (**MR**), **PRI #** (**VFO**) and **TSET ABC** (**2**) depressed while turning on the transceiver. If CPU problems remain after performing the soft reset, a hard CPU reset may be performed as follows.

- ☐ Turn the transceiver off and disconnect all cables.
- ☐ Separate the front and rear transceiver body halves (as shown in *Transceiver Disassembly* on page 2-1).
- ☐ Remove the solder from jumper **JP1008** on the CNTL Unit near the lithium battery (as shown in the drawing).
- ☐ After waiting several minutes, resolder the jumper and reassemble the transceiver.

The FT-51R electronics consists of three major boards: the 144 and 430 (MHz) motherboards (or Mother Units) and the Control Unit, and numerous minor boards that mount on these. The motherboards include the receiver front ends, IF and PLL subsystem ICs, and support daughter boards for transmit stages, local VCOs, supply regulation and switching circuits. The Control Unit includes the microprocessors and tone generator/decoder chips, and supports daughter boards for the display, keys and keypad, audio circuits and an contact board for coupling with the motherboards. While reading this description, you can refer to the block diagram for an overview of the major circuit blocks, and to the schematic diagrams for component details.

Antenna Duplexer

Incoming RF from the antenna jack passes through a 450-MHz low-pass filter on the 430 Mother Unit before application to two band-switching networks: coil L3008, diode D3003 & 3006 and capacitor C3040 on the 430 Mother Unit for UHF signals; and coil L2006, diode D2003 & 2007 and capacitor C2026 on the 144 Mother Unit for VHF signals. These networks filter VHF signals from the UHF receiver and UHF signals from the VHF receiver, allowing each band to operate independently while sharing the same antenna connection.

VHF Reception

VHF signals passed by the duplexer are applied to a varactor-tuned band-pass filter consisting of L2016 and L2019 before RF amplification by Q2032 (2SC4537). The amplified RF is then band-pass filtered again by varactor-tuned resonators L2015/D2018 and L2018 to ensure pure in-band input to 1st mixer Q2029/D2017 (2SC4537). Tuning voltage for the varactors is provided by VHF PLL Q2007, buffered by Q2014 (2SK880GR).

Buffered 189.05 ~ 199.05-MHz output from the 144-VCO Unit is amplified by Q2002 (2SC4537) and applied to the 1st mixer. The resulting 45.05-MHz 1st mixer product is passed through monolithic crystal filter XF2001 (± 7.5 -kHz BW) to strip away all but the desired signal, which is then amplified by Q2028 (2SC4215Y) before delivery to FM IF subsystem IC Q2031 (TK10930V), containing the 2nd mixer, 2nd local oscillator, limiter amplifier, noise amplifier, S-meter amplifier and squelch gates. A 2nd local signal is generated from 44.595-MHz crystal X2001, which produces the 455-kHz 2nd IF when mixed with the 1st IF signal within Q2031. The 2nd IF is passed through ceramic filter CF2001 to strip away unwanted mixer

products, and is then applied to the limiter amp in Q2031, which removes amplitude variations in the 455-kHz IF before detection of the speech by ceramic discriminator CD2001. Detected audio from pin 12 of Q2031 is delivered to the CNTL Unit.

VHF Squelch Control

When no carrier is received, noise at the output of the detector stage in Q2031 is amplified and band-pass filtered by the noise amp section of Q2031 and the network between pins 19 and 20, and then rectified by D2013. The resulting DC squelch control voltage is passed to pin 99 of Main CPU Q1002. While no carrier is received, pin 54 of Q1002 remains low, signaling pin 8 of Sub CPU Q1001 (M38223E4HP) on the Control Unit to keep the green (Busy) half of the VHF LED off, and holding the AF MUTE line low to block VHF receiver audio from passing through analog gate Q1015-1 while no signal is being received, and during transmission.

When a carrier appears at the discriminator, noise is removed from the output, causing pin 54 of Q1002 to go high and signaling microprocessor Q1001 to activate the BUSY LED. The microprocessor then checks CTCSS chip Q1004 (AK2343) and DTMF decoder chip Q1007 (TC35305F) for CTCSS or DTMF code squelch information, respectively. If not transmitting and tone squelch is not activated, or if the received tone matches that programmed, the microprocessor stops scanning, if active, and allows audio to pass through muting and amplifier IC Q1023 (TDA7233D) to the loudspeaker.

VHF Single-Band Dual Receive

When VHF single-band dual receive operation is active, a portion of the received VHF RF passing through the antenna switching network (and applied to the VHF front end) is sampled through diodes D2006 on the 144 Mother Unit and D3007 on the 430 Mother Unit, the signals are band-pass filtered and amplified by Q3013 (2SC4226) before application to mixer Q3014 (2SC4215Y). This mixer also receives output from the 430-VCO Unit, after it is divided by four in Q3024 (μ PB587G) on the 430-Mother Unit. The resulting 58.525-MHz sub-receiver 1st IF signal is applied to the UHF receiver IF chain before monolithic filter XF3001, and is then handled just as a UHF signal would be in UHF operation.

AF Output

On the CNTL Unit, detector audio from either the 144 or 430 Mother Unit is applied through analog switch Q1015-1 or -2 ($\frac{1}{4}$ NJU4066BV) to remove the

Circuit Description

CTCSS tone, if present, and adds keypad beeps and DTMF monitor tones as needed. The resulting audio is delivered through the respective volume control and audio selector Q1006 (MB87078PF) on the CNTL Unit, which selects VHF and UHF audio on the internal or external (EAR jack) loudspeakers, separate or mixed, through Q1018, Q1019 (2SC4617x2) and audio amplifier Q1023 (TDA7233D) on the CNTL Unit.

UHF Reception

UHF signals passed by the duplexer are applied to a varactor-tuned band-pass filter consisting of L3029, TC3005 and D3021/D3025 before RF amplification by Q3039 (2SC4228). The amplified RF is then band-pass filtered again by varactor-tuned resonators TC3004, L3028, D3020, D3024 and TC3003, L3027, D3019, D3023, further amplified by Q3038 (2SC4228) and filtered once more by TC3002, L3026, D3018 and D3022 to ensure pure in-band input to 1st mixer Q3035 (2SC4226). Tuning voltage for the varactors is provided by UHF PLL Q3009, buffered by Q3015 (2SK880GR).

Buffered output between 371.475 ~ 391.475-MHz from the 430-VCO Unit is amplified by Q3003 (2SC4245) and applied to the 1st mixer. The resulting 58.525-MHz 1st mixer product is passed through monolithic crystal filter XF3001 (± 7.5 -kHz BW) to strip away all but the desired signal, which is then amplified by Q3034 (2SC4215Y) before delivery to FM IF subsystem IC Q3037 (MC3372VM), which contains the 2nd mixer, 2nd local oscillator, limiter amplifier, noise amplifier, S-meter amplifier and squelch gates.

A 2nd local signal is generated from 58.07-MHz crystal X3002, which produces the 455-kHz 2nd IF when mixed with the 1st IF signal within Q3037. The 2nd IF is passed through ceramic filter CF3001 to strip away unwanted mixer products, and is then applied to the limiter amp in Q3037, which removes amplitude variations in the 455-kHz IF before detection of the speech by ceramic discriminator CD3001.

Detected audio from pin 9 of Q3037 is delivered via the 430 Mother Unit, CONTACT Unit and CNTL Unit (for sampling by CTCSS & DTMF detectors and de-emphasis). Receiver audio amplification is as already described.

UHF Squelch Control

When no carrier is received, noise at the output of the detector stage in Q3037 is amplified and band-pass filtered by the noise amp section of Q3037 and

the network between pins 9 and 10, and then rectified by D3014. The resulting DC squelch control voltage is passed to pin 98 of main CPU Q1002. While no carrier is received, pin 55 of Q1002 remains low, signaling pin 7 of sub-CPU Q1001 on the Control Unit to keep the green (Busy) half of the UHF LED off, and holding the AF MUTE U line low to block UHF receiver audio from passing through analog gate Q1015-2 while no signal is being received, as well as during transmission.

When a carrier appears at the discriminator, noise is removed from the output, causing pin 55 of Q1002 to go high and signaling microprocessor Q1001 to activate the BUSY LED. The microprocessor then checks CTCSS chip Q1004 (AK2343) and DTMF decoder chip Q1007 (TC35305F) for CTCSS or DTMF code squelch information, respectively. If not transmitting and tone squelch is not activated, or if the received tone matches that programmed, the microprocessor stops scanning, if active, and allows audio to pass through mute and amplifier IC Q1023 (TDA7233D) to the loudspeaker.

UHF Single-Band Dual Receive

When UHF single-band dual receive operation is active, a portion of the received UHF RF passing through the antenna switching network (and applied to the UHF front end) is sampled via diode D2008 on the 144-Mother Unit and diode D3026 on the 430-Mother Unit. Here, the signals are band-pass filtered and amplified by Q2017 and Q2018 (both 2SC4227) before application to mixer Q2016 (2SC4537). This mixer also receives the third harmonic of the 144-VCO Unit. The resulting 45.05-MHz sub-receiver 1st IF signal is applied to the VHF receiver IF chain just before monolithic filter XF2001, and is then handled just as a VHF signal would be in VHF operation.

Transmitter Audio Stages

Speech input from the microphone is delivered to Q1006 (MB87078PF) for pre-emphasis then passes through the splatter filter section within Q1004 and Q1006 (MB87078PF) for IDC (instantaneous deviation control) before delivery to the modulator.

If Tone Burst or DTMF is enabled for transmission, the tone is generated by main CPU Q1002, buffered by Q1004 and applied to the IDC stage in place of speech audio. Also, the tone is amplified for monitoring in the loudspeaker, as mentioned before. The sub-CPU closes Mic Mute gate Q1004 when transmitting a tone, or when transmission is disabled.

The modulating audio is delivered first to the Control Unit, where it may pick up a generated CTCSS tone, then is next delivered to both Mother Units, where it is either disabled (on the receiving band) by Q2003 (VHF) or Q23004 (UHF, both DTC142EE), or delivered to modulating varactors D5003 (in the UHF VCO) or D4003 (in the VHF VCO), frequency modulating the PLL carrier up to ± 5 kHz from the unmodulated carrier at the transmitting frequency.

Late VHF Transmit Stages

On the 144 VCO Unit, the modulated signal from VHF VCO Q4001 (2SC4226) is buffered by Q4002 and Q4003 (both 2SC4226) and returned to the 144 Mother Unit for amplification by Q2002 (2SC4537), and then final amplification by VHF PA module Q2001 (S-AV28) on the 144 Mother Unit. The transmit signal then passes through antenna t/r switch D2003 before returning to the duplexer network on the 144 Mother Unit and then a low-pass filter consisting of L2002, L3003, C2017, C2018, C2012 and the duplexer consisting of C2019 (mounted on the 144 Mother Unit) and L3010, C3034, C3165 and the LPF (L3004, L3005, C3027, C3028, C3014) mounted on the 430 Mother Unit, before delivery to the antenna.

VHF Automatic Transmit Power Control (APC)

RF power output from the VHF final amplifier is sampled and rectified by D2001 (1SS321). The resulting DC is fed back through Q2004 (2SA1586) and Q2008 (2SC4617) to driver Q2002 (2SC4537) on the 144 Mother Unit, controlling the level of drive to the PA module, and thus the power output. The microprocessor selects either high or one of four low power levels via Q2011 (XP1401).

When the VHF transmitter PLL is unlocked, or while receiving, the unlock signal from Q2007 causes the ULT3V line to be dropped via Q2006 (DTA124EE), and Q2013 (DTC124EE), which disables transmission by biasing final amplifier Q2001 off and opening VHF t/r switch D2003.

VHF Transmit/Receive Switching

Closing the PTT switch on the Key Unit pulls one side of the microphone low, which turns on Q1010 (DTA144EE), causing pin 95 of microprocessor Q1002 on the Control Unit to go high. The microprocessor then delivers appropriate serial data to sub-CPU Q1001 to raise the TXV line to the 144 Mother Unit (via the Contact Unit) where Q2020 (UMB10) turns off the receiver, and Q2023 (DTC144EE) and Q2015 (DTA123EE) turn on the transmitter. This tx signal is delivered to the 144 Mother Unit where it causes the

ULT3V line to go high, which in turn biases the VHF PA module on and closes t/r switch D2003 on the 144 Mother Unit. At the same time, Q2005 on the 144 Mother Unit turns on Q2002 on the 144 Mother Unit to drive the PA module.

Late UHF Transmit Stages

On the 430 VCO Unit, the modulated signal from UHF VCO Q5001 (2SC5006) is buffered by Q5003 and Q5002 (2SC5006) and returned to the 430 Mother Unit for amplification by Q3003 (2SC4245), and then final amplification by UHF PA module Q3002 (M67799MA) on the 430 Mother Unit. The transmit signal then passes through antenna t/r switch D3003 before returning to the duplexer network and the high-pass filter consisting of L3003~3005, C3021, C3022, C3014, C3027~3028, C3165 and the high-pass filter consisting of L3009, L3012, C3010, C3011, C3020 and C3029, mounted on the 430 Mother Unit before delivery to the antenna.

UHF Automatic Transmit Power Control (APC)

RF power output from the UHF final amplifier is sampled and rectified by D3001 (1SS321). The resulting DC is fed back through Q3005 (A1586Y) and Q3008 (2SC4617) to driver Q3001 (2SC4537) and Q3003 (2SC4245) on the 430 Mother Unit, controlling the level of drive to the PA module, and thus the power output. The microprocessor selects either high or one of four low power levels via Q3011 (XP1401).

When the UHF PLL is unlocked, or while receiving, the unlock signal causes the ULT3U line to be dropped via Q3007 (DTA144EE), and Q3012 (DTC124EE), which disables the transmitter by biasing final amplifier Q3002 off and opening UHF t/r switch D3003.

UHF Transmit/Receive Switching

As for UHF, closing the PTT line raises the TXU line via Q1010 and Q1002 on the Control Unit. This line connects to the 430 Mother Unit (via the Contact Unit) where Q3026 (UMB10N) turns off the receiver, and Q3017 (XP4213) and Q3022 (UMB10N) turn on the transmitter. This tx signal is delivered to the 430 Mother Unit where it causes the ULT3U line to go high, which in turn biases the UHF PA module on and closes t/r switch D3003 on the 430 Mother Unit. At the same time, Q3004 on the 430 Mother Unit turns on Q3003, Q3001 on the 430 Mother Unit to drive the PA module.

Circuit Description

VHF PLL Frequency Synthesizer

The VHF PLL circuitry consists of VCO Q4001 and VCO buffer Q4003 (both 2SC4226) on the 144 VCO Unit; PLL subsystem IC Q2007 (FQ7925) on the 144 Mother Unit, and 12.8-MHz reference oscillator X3001/Q3009 on the 430 Mother Unit. Q2007 contains a prescaler, reference divider, serial-to-parallel data latch, programmable divider, phase comparator, charge pump, band selector and a power saver circuit.

While receiving, VCO Q4001 oscillates between 189.05 and 199.05 MHz according to the transceiver version and the programmed receiving frequency. The VCO output is buffered by Q4003 and returned to the 144 Mother Unit, where a sample of that output is applied to the prescaler section of Q2007. There the VCO signal is divided by 64 or 65, according to a control signal from the data latch section of Q2007, before being applied to the programmable divider section of Q2007.

The data latch section of Q2007 also receives serial dividing data from sub-cpu Q1001 on the Control Unit, which causes the pre-divided VCO signal to be further divided in the programmable divider section, depending upon the desired receive frequency, so as to produce a 5-kHz or 6.25-kHz derivative of the current VCO frequency. Meanwhile, the reference divider section of Q2007 divides the 12.8-MHz crystal reference from the 430 Mother Unit, after buffering by Q3036 (2SC4617), by 2560 (or 2048) to produce the 5-kHz (or 6.25-kHz) loop reference (respectively).

The 5-kHz (or 6.25-kHz) signal from the programmable divider (derived from the VCO) and that derived from the reference oscillator are applied to the phase detector section of Q2007, which produces a pulsed output with pulse duration depending on the phase difference between the input signals. This pulse train is filtered to DC and returned to varactor D4001 on the 144 VCO Unit.

Changes in the level of the DC voltage applied to the varactors affect the reactance in the tank circuit of the VCO, changing the oscillating frequency of the VCO according to the phase difference between the signals derived from the VCO and the crystal reference oscillator. The VCO is thus phase-locked to the crystal reference oscillator.

The output of VCO Q4001, after buffering by Q4002 and Q4003, is delivered to the 144 Mother Unit for amplification by Q2002 before application to the 1st mixer, as described previously.

For VHF transmission, VCO Q4001 oscillates between 140 and 150 MHz according to the model version and programmed transmit frequency. The remainder of the PLL circuitry is shared with the receiver. However, the dividing data from the microprocessor is such that the VCO frequency is at the actual transmit frequency (rather than offset for IFs, as in the receiving case). Also, the VCO is modulated by the speech audio applied to D4003, as described previously. Receive and transmit buses select which VCO is made active by Q4004 (DTC143ZE). FET Q2014 (2SK880GR) on the 144 Mother Unit buffers the VCV line for application to the tracking band-pass filters in the receiver front end.

When the power saving feature is active, the microprocessor periodically signals the PLL IC to conserve power and shorten lock-up time.

UHF PLL Frequency Synthesizer

The UHF PLL circuitry consists of VCO Q5001 and VCO buffers Q5002 and Q5003 (all 2SC5006) on the 430 VCO Unit, and PLL subsystem IC Q3009 (FQ7925) and 12.8-MHz reference oscillator X3001 on the 430 Mother Unit. Q3009 contains a prescaler, reference divider, serial-to-parallel data latch, programmable divider, phase comparator, band selector and a power saver circuit.

For receiving, VCO Q5001 oscillates between 488.525 and 508.525 MHz according to model version and the programmed receiving frequency. A portion of the VCO output is buffered by Q5003 and returned to the prescaler section of Q3009 on the 430 Mother Unit. There the VCO signal is divided by 64 or 65, according to a control signal from the data latch section of Q3009, before being applied to the programmable divider section of Q3009.

The data latch section of Q3009 also receives serial dividing data from sub-cpu Q1001 on the Control Unit, which causes the pre-divided VCO signal to be further divided in the programmable divider section, depending upon the desired receive frequency, so as to produce a 5-kHz or 6.25-kHz derivative of the current VCO frequency. Meanwhile, the reference divider section of Q3009 divides the 12.8-MHz crystal reference by 2560 (or 2048) to produce the 5-kHz (or 6.25-kHz) loop reference (respectively).

The 5-kHz (or 6.25-kHz) signal from the programmable divider (derived from the VCO) and that derived from the reference oscillator are applied to the phase detector section of Q3009, which produces a dual pulsed output with pulse duration depending on the phase difference between the input signals.

This pulse train is filtered to DC and returned to varactor D5001 on the 430 VCO Unit.

Changes in the level of the DC voltage applied to the varactors affect the reactance in the tank circuit of the VCO, changing the oscillating frequency of the VCO according to the phase difference between the signals derived from the VCO and the crystal reference oscillator. The VCO is thus phase-locked to the crystal reference oscillator.

The output of VCO Q5001 is also buffered by Q5002 & Q5003 and is then delivered to the 430 Mother Unit for amplification by Q3003 before application to the 1st mixer, as described previously.

For UHF transmission, VCO Q5001 oscillates between 430 and 450 MHz according to the model version and programmed transmit frequency. The remainder of the PLL circuitry is shared with the receiver. However, the dividing data from the microprocessor is such that the VCO frequency is at the actual transmit frequency (rather than offset for IFs,

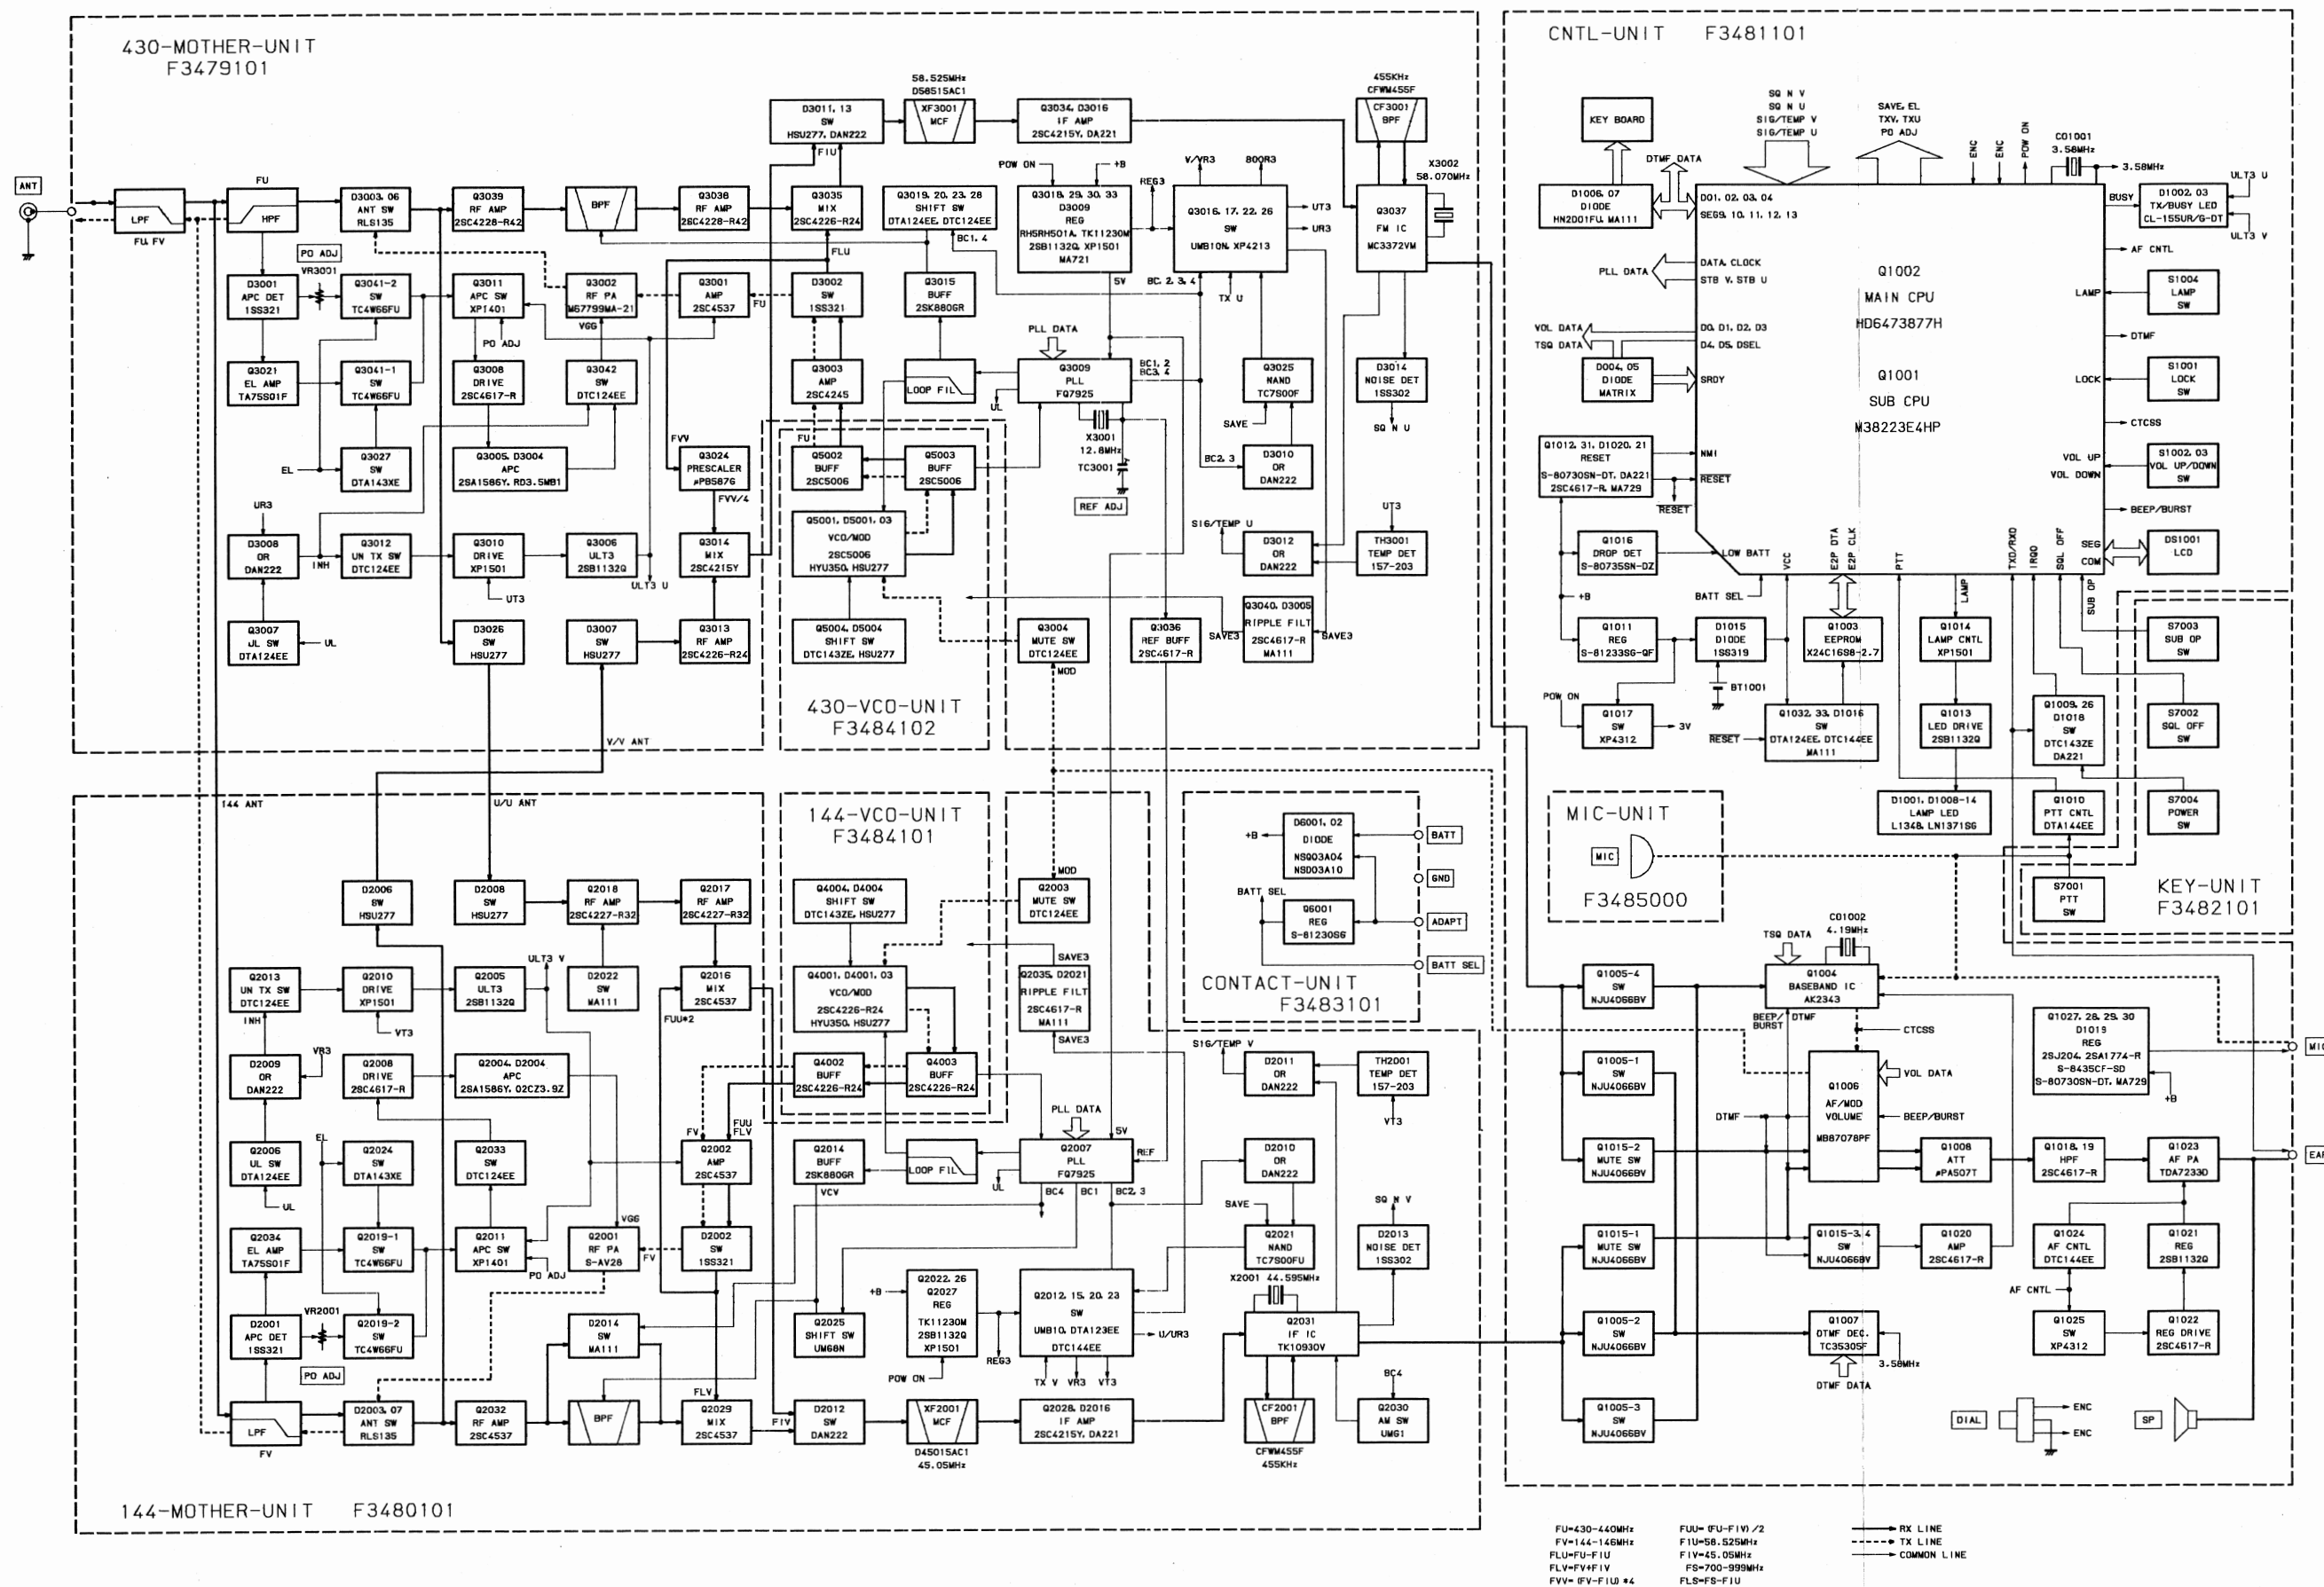

as in the receiving case). Also, for transmission, the VCO is modulated by the filtered speech audio applied to the tank circuit at D5003, as described previously. Receive and transmit buses select which VCO is to be active by Q5004 (DTC143ZE), respectively. FET Q3015 (2SK880GR) on the 430 Mother Unit buffers the VCV line for application to the tracking band-pass filters in the receiver front end.

When the power saving feature is active, the microprocessor periodically signals the PLL IC to conserve power and shorten lock-up time.

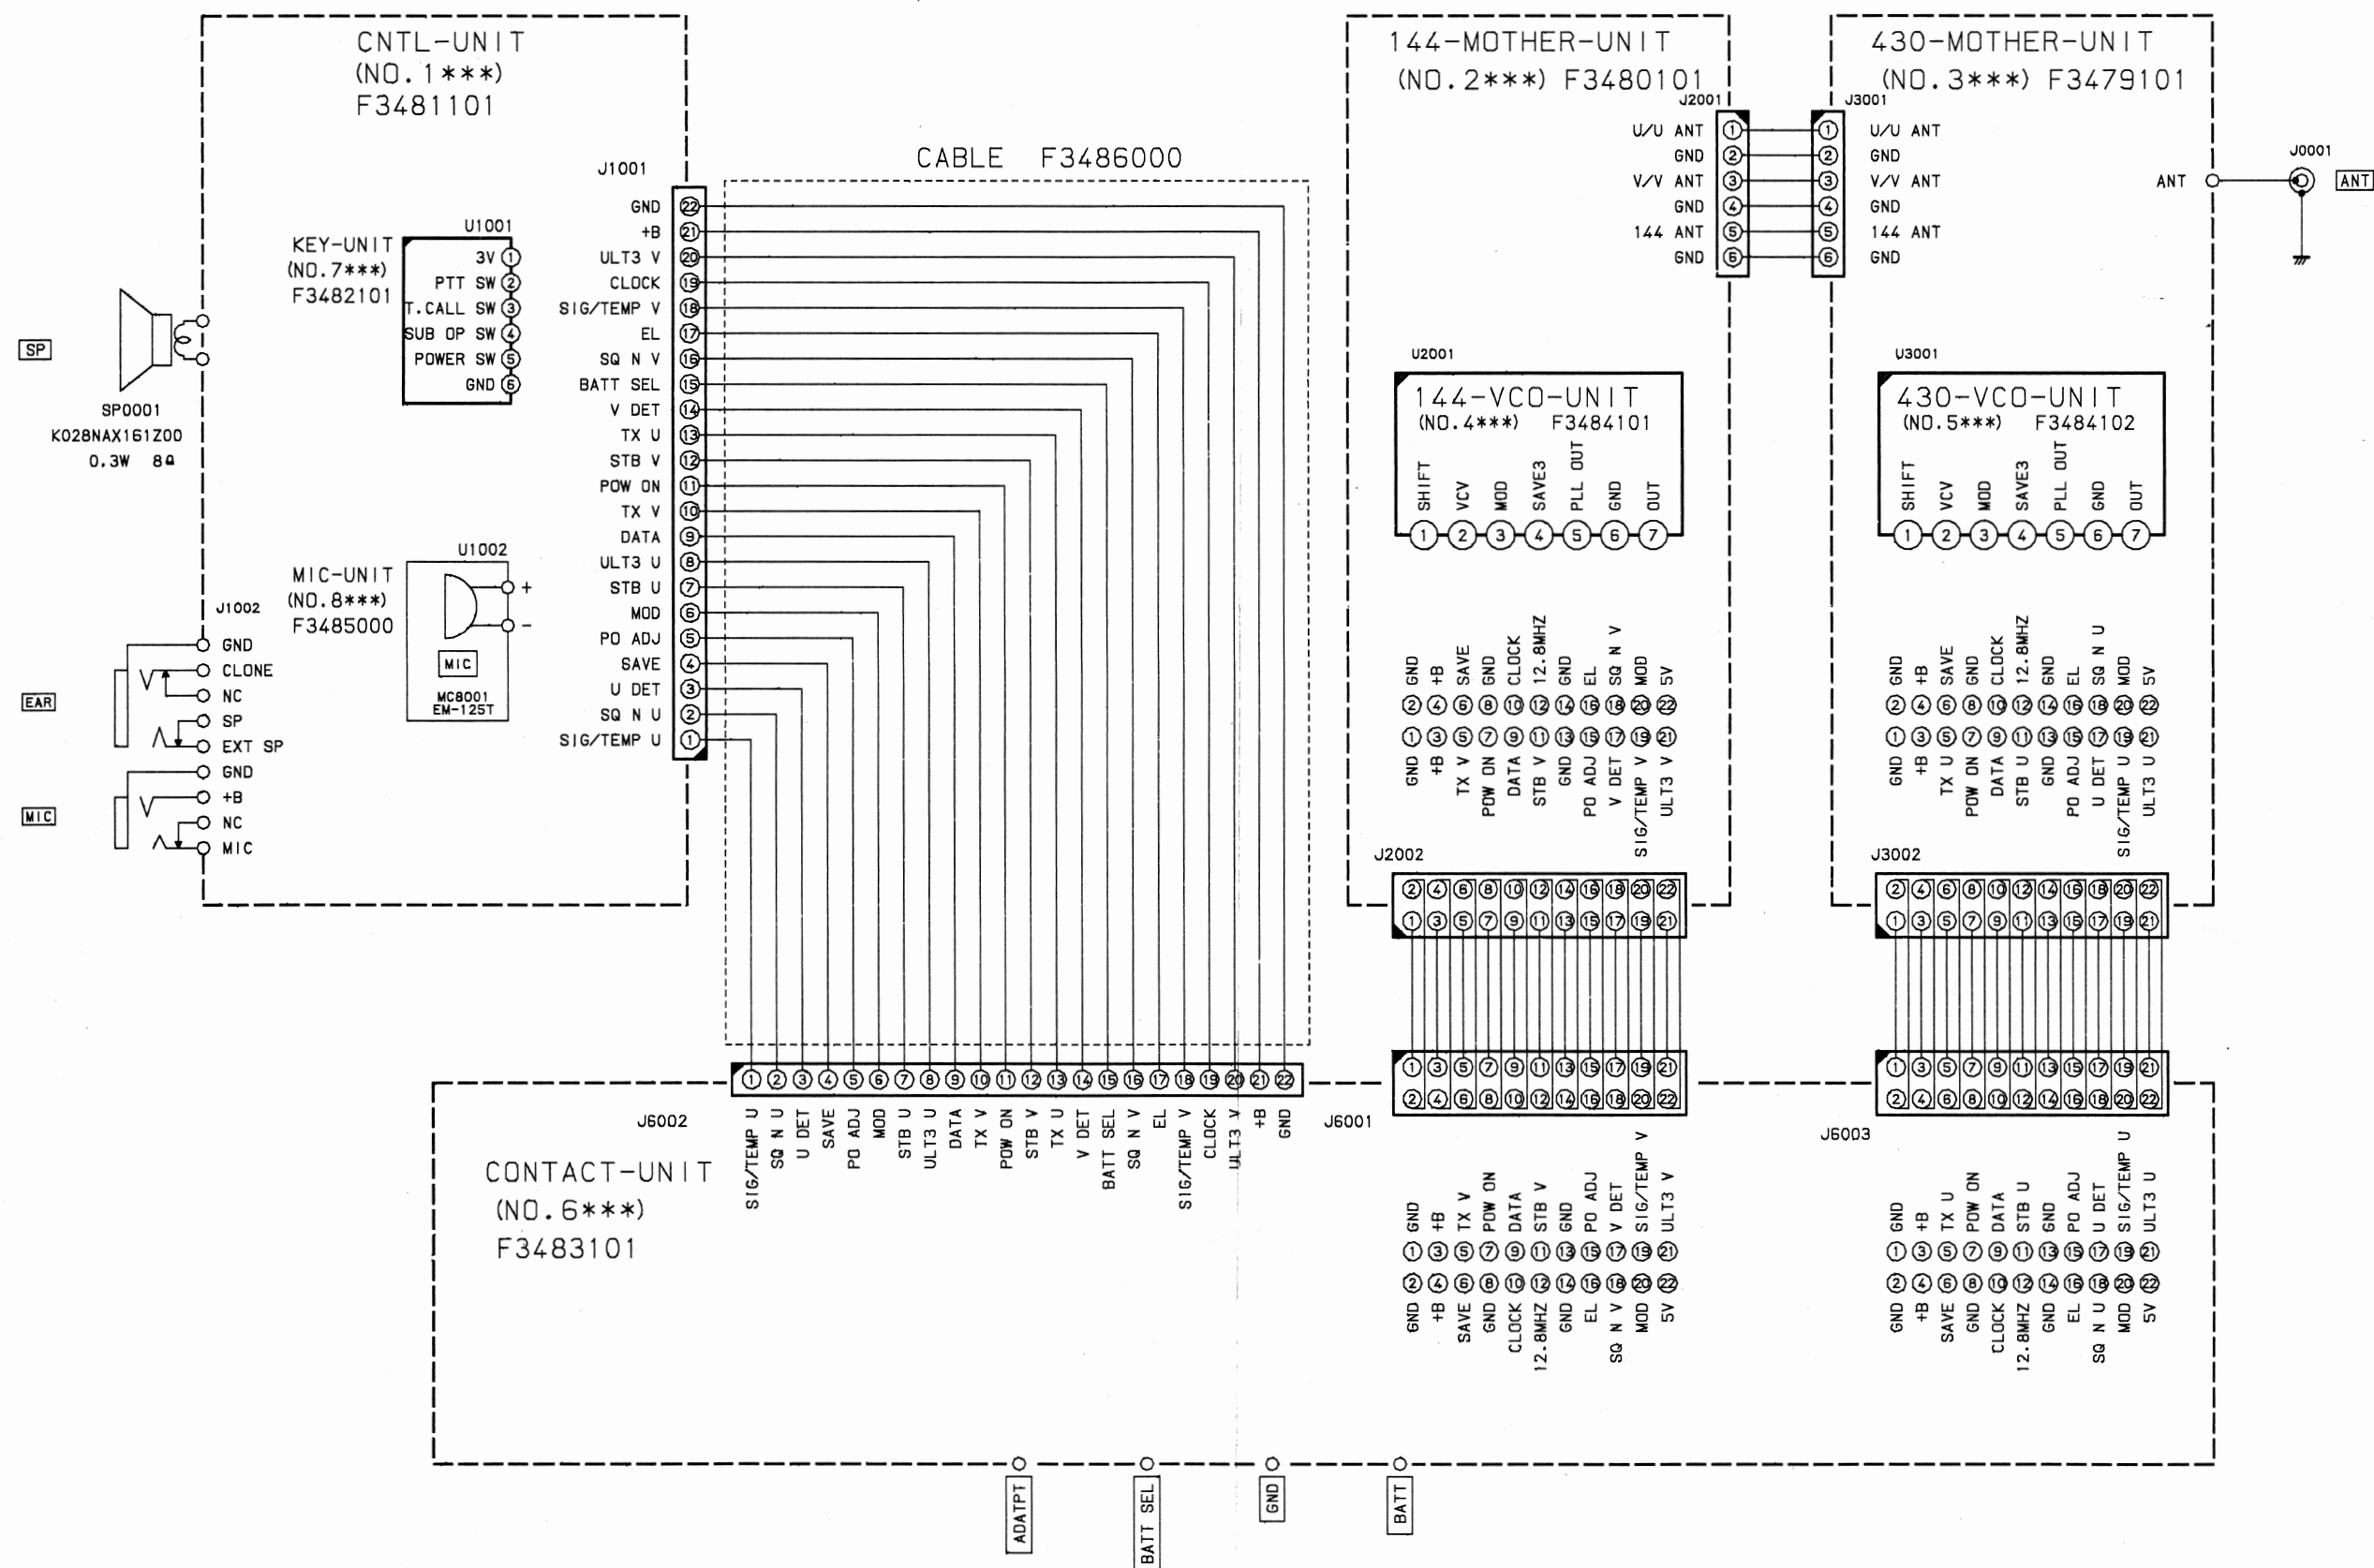

Power-On Sequencing

Pressing the orange POWER switch applies 3 volts to POWER SW pin 94 of microprocessor Q1002 to wake it up. This provides 3 volts via Q1017 (XP4312) on the Control Unit. At the same time, Q1002 provides 3 V via regulator IC Q2022 and Q2023 (both TK11230M) on the 144 and 430 Mother Units.
